

INTRODUCCION

El presente documento ha sido preparado para consignar uso de metodología AP-42 de la Agencia de Protección Ambiental de los Estados Unidos de Norteamérica. Esta metodología se utilizan para evaluar el inventario de emisiones, que en promedio, emiten fuentes convencionales. Las expresiones de cálculo que se consignan en la AP-42, son resultado del estudio y evaluación empírica durante un extenso periodo de tiempo. El uso de estas expresiones de cálculo debe ser cuidadoso debido a que su aplicabilidad redunda en las características inherentes de un equipo emisor. Principalmente la metodología es utilizada para evaluar sistemas térmicos que utilizan combustibles, considerados convencionales, y cuyo uso es en combustión.

De manera general este documento cita explícitamente la metodología AP-42, no se vierten comentarios personales o concepto alguno. La metodología se utiliza como una guía, debido a que el proceso de combustión en general es propio de cada configuración de una unidad térmica.

METODOLOGÍA PARA ESTIMACIÓN DE EMISIONES PARA COMBUSTIBLES DE ORIGEN BIOMASICO UTILIZADO EN FUENTES DE COMBUSTIÓN EXTERNAS

La metodología de cálculo consiste en obtener un factor de emisión considerando características como el combustible utilizado, el tamaño de la unidad térmica, el nivel de actividad, sistemas de control de aire y pre y pos tratamiento de los gases de combustión. Cada factor cuenta con un índice de confianza que evidencia la contundencia de mismo. El factor es tabulado según ciertas dimensiones y los datos de entrada para realizar la estimación deben ser consistentes con estos. El cálculo de la emisión esta dado por la siguiente expresión.

$$\text{Emisión} = \text{factor de emisión} * \text{grado de actividad}$$

$$E = f * G$$

Las unidades de G pueden ser temporalmente dependientes o el valor total comprendido en un periodo de tiempo finito, y como se comentó anteriormente deben poseer consistencia dimensional con el factor de emisión.

Según la emisión que se requiere calcular se debe ubicar en las tablas que a continuación se presentan los respectivos factores de emisión, de acuerdo principalmente al tamaño de la unidad térmica.

- a Units of lb of pollutant/million Btu (MMBtu) of heat input. To convert from lb/MMBtu to lb/ton, multiply by (HHV * 2000), where HHV is the higher heating value of the fuel, MMBtu/lb, CPM = Condensible Particulate Matter. These factors apply to Source Classification Codes (SCC) 1-0X-009-YY, where X = 1 for utilities, 2 for industrial, and 3 for commercial/institutional, and where Y = 01 for bark-fired boiler, 02 for bark and wet wood-fired boiler, 03 for wet wood-fired boiler, and 08 for dry wood-fired boiler.
- b PM-10 = particulate matter less than or equal to 10 microns in aerodynamic diameter. PM-2.5 = particulate matter less than or equal to 2.5 microns in aerodynamic diameter. Filterable PM = PM captured and measured on the filter in an EPA Method 5 (or equivalent) sampling train. Condensible PM = PM captured and measured in an EPA Method 202 (or equivalent) sampling train.
